

1. Continuous-time and discrete-time models	9
1.1. Basic information	9
1.1.1. Models	9
1.1.2. Laurent transform	9
1.1.3. Discrete-time models	10
1.1.4. Discretisation of continuous-time models	12
1.2. Exercises and the report	13
1.2.1. Calculations for discrete-time and continuous-time models	13
1.2.2. Simulation with continuous-time and discrete-time models	14
1.2.3. Discretisation of discrete-time models	14
2. Signals in system identification	16
2.1. Basic information	16
2.1.1. Common signals in system identification	16
2.1.2. Statistical characteristics of a signal	16
2.1.3. The order of excitation	19
2.2. Exercises and the report	20
2.2.1. Basic signal characteristics	20
2.2.2. The order of persistent excitation	20
2.2.3. The order of persistent excitation – calculations	21
3. Nonparametric methods – transient and frequency analysis	22
3.1. Basic information	22
3.1.1. Transient response identification	22
3.1.2. Determining the transfer function from the step response	22
3.1.3. Frequency analysis	28
3.2. Exercises and the report	30
3.2.1. System identification using step responses	30
3.2.2. Frequency analysis	30
4. Nonparametric methods – correlation and spectral analysis	31
4.1. Basic information	31
4.1.1. Impulse response model	31
4.1.2. Correlation analysis	31

4.1.3. Spectral analysis	32
4.2. Exercises and the report	33
4.2.1. Correlation and spectral analysis	33
4.2.2. FIR model	33
5. Deterministic models and the least-squares method	34
5.1. Basic information	34
5.1.1. Deterministic models in parametric system identification	34
5.1.2. Least-squares method	36
5.1.3. Influence of the persistent excitation order on parameter estimation	36
5.2. Exercises and the report	37
5.2.1. Parameter estimation for a system without a delay	37
5.2.2. Parameter estimation for a system with a delay	37
5.2.3. Influence of the excitation order on the estimation	38
6. Stochastic models and the least-squares method	39
6.1. Basic information	39
6.1.1. Elementary stochastic models in system identification	39
6.1.2. Least-squares method for the ARX model	40
6.1.3. Evaluation of the system identification result	41
6.2. Exercises and the report	42
6.2.1. Parameter estimation for the ARX model	42
6.2.2. Evaluation of the results	43
7. Model order estimation	44
7.1. Basic information	44
7.1.1. Estimation of the order	44
7.2. Exercises and the report	45
7.2.1. Estimation of the order in a case without disturbance	45
7.2.2. Estimation of the order in the presence of disturbance	46
8. Instrumental variables method	47
8.1. Basic information	47
8.1.1. ARMAX and OE models	47

8.1.2. Instrumental variables method	48
8.2. Exercises and the report	49
8.2.1. Comparison of the least-squares and instrumental variables methods	49
8.2.2. Instrumental variables method and the order estimation	50
9. System identification in a closed loop	51
9.1. Basic information	51
9.1.1. Problem of system identification in a closed loop	51
9.1.2. Conditions for identifiability in a closed loop	51
9.1.3. Solution to the problem	52
9.2. Exercises and the report	52
9.2.1. Identifiability conditions for the system in a closed loop	52
9.2.2. Solution to the problem of unidentifiability	53
10. Recursive estimation methods	54
10.1. Basic information	54
10.1.1. Recursive least-squares method	54
10.1.2. Recursive instrumental variables method	55
10.1.3. Recursive extended least-squares method	55
10.2. Exercises and the report	56
10.2.1. The choice of the method matching the system	56
10.2.2. Recursive identification	57
Matlab commands	58
